

Project Proposal (Proposed Solution)

Date	25 September 2026
Team ID	6ab2220abee0b08a2d2c65d0
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Proposed Solution Report

The proposed solution is a zero-touch, automated IT Service Management (ITSM) categorizer built natively on the ServiceNow platform. The primary objective is to intercept incoming user incident tickets before they are committed to the database and intelligently assign the correct Category and Subcategory based on the natural language provided in the Short Description.

The backend logic utilizes Server-Side JavaScript via Business Rules. This allows the system to parse incoming strings, convert them to lowercase, and search for specific contextual keywords (e.g., wifi, projector, password). Upon a successful match, the record is automatically populated with the correct assignments.

Finally, ServiceNow Flow Designer is utilized to orchestrate the post-classification workflow, immediately dispatching a confirmation email to the user. This entirely eliminates the manual triage process for Level-1 Helpdesk agents.
