Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The proposal report aims to transform IT ticket management using keyword-based automation, boosting efficiency and accuracy. It tackles system inefficiencies, promising better operations, reduced delays, and improved user satisfaction.

Project Overview	
Objective	Automate the classification of IT support tickets using keyword parsing in ServiceNow Business Rules, eliminating manual categorization.
Scope	The project covers the creation of a custom table (u_incident_workflow), a server-side Business Rule for auto-classification, and a Flow Designer flow for email notifications.

Problem Statement	
Description	IT support tickets are manually read and categorized by helpdesk agents, causing delays, misrouting, and user frustration.
Impact	Solving this will result in instant ticket routing, reduced resolution time, and improved end-user satisfaction with the IT service.

Proposed Solution	
Approach	Server-Side JavaScript Business Rules parse the Short Description field using indexOf() to detect keywords (wifi, projector, etc.) and update the category field.
Key Features	- Keyword-based auto-classification via Business Rules. - Automated email notification via Flow Designer. - REST API wrapper (Express.js) for external ticket submission.

Resource Requirements

Resource Type	Description	Specification / Allocation
Hardware	Computing Resources	ServiceNow Cloud (SaaS, no local hardware needed)
Software	Platform	ServiceNow Developer Instance (Washington DC release)
Software	Frameworks	Express.js (Node.js)
Software	Libraries	axios, cors, dotenv
Software	Development Environment	VS Code, ServiceNow Studio
Data	Data Source	User-submitted IT incident descriptions (text input)
